

# PDVM

**Perforated diffuser**

**Supply**

**T-bar mounted in modular ceiling**

**Downflow**

## **Use**

The PDVM downflow ceiling diffuser is suitable for supplying cooled air with a small temperature difference. The diffuser can be T-bar mounted in a modular ceiling. The diffuser is designed for supplying rooms with an extremely high number of air changes, such as laboratories or computer rooms.

As the end velocity in the occupied zone depends on the temperature difference, the use and layout of the room must be taken into account when the supply panels are installed. As standard, the plenum box is equipped with 8 mm hanging holes in the raised edge of the plenum.

## **Characteristics**

Max. number of air changes:	up to 100 x
Undertemperature:	up to 6 K
Overttemperature	0 K

## **Version**

### **Ceiling diffuser**

material:	steel
post-treatment:	epoxy
colour:	white RAL 9010, optional RAL colour of your choice

### **Top section**

material:	sendzimir galvanised steel
post-treatment:	none

### **Plenum box**

material:	sendzimir galvanised steel
post-treatment:	none

## **SA-Select**

Check SA-select to create extended order codes and selection details online. **NB!** At this moment, SA-Select is only available in Dutch. But it is possible to create extended order codes and selection details online.

## **Available types**

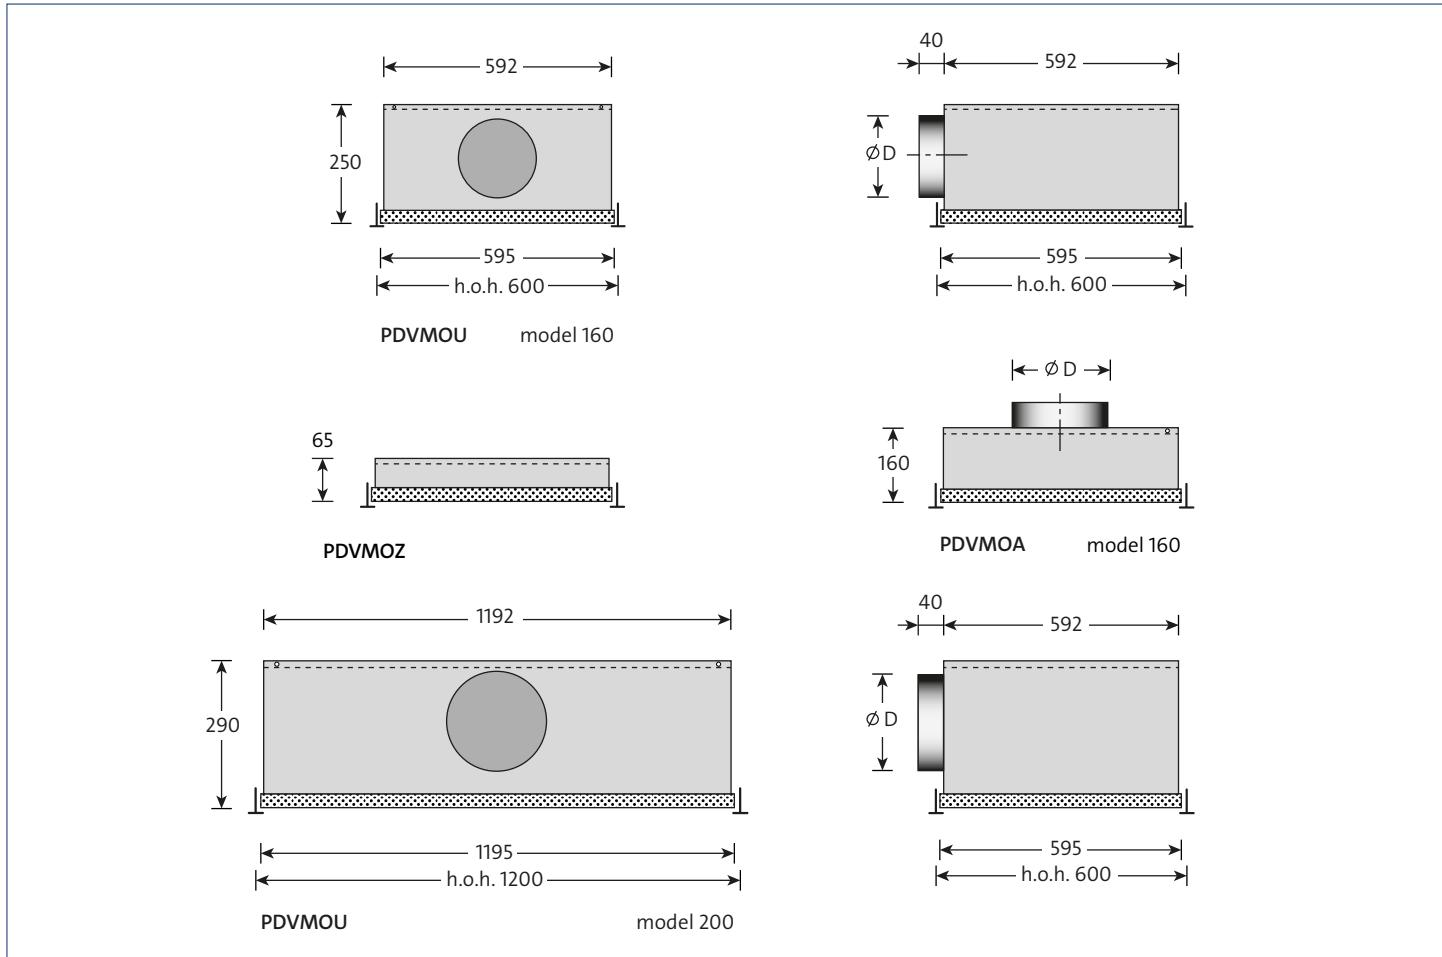

### **PDVM O -**

- P** perforated ceiling diffuser
- D** downflow
- V** flat face plate
- M** modular ceiling, panel size 600 mm
- O** no accessories

#### - **Version**

- A** round top connection
- R** internally insulated plenum box
- U** uninsulated plenum box
- Z** square top connection

## Dimensions

## Available dimensions and sizes

model	panel	D
<b>160</b>	600 x 600	158
<b>200</b>	600 x 1200	198

## Note

- The dimensions are in mm.

## Selection details

## General

- The velocities in the table apply in an isothermal situation and for individual panels.
- The values must be used as a guideline. The end velocity of the descending air column highly depends on the effective temperature difference between the supply air and the room air.
- Vertical air patterns can be used for a high number of air changes.
- It is preferable to project the extraction points over the heat source or sources.
- The panels may not be fitted directly above people who stay in one place.
- The assumed room attenuation is 10 dB.
- It is permitted to interpolate the interim values.
